

One Solution

FOR CONTINUOUS INSULATION

STYROFOAM™ CLADMATE™ CM20 insulation is designed with the builder and contractor in mind. Changes to many Building Codes include requirements for increased R-values and improved air sealing control measures. With these new requirements come many options, which sometimes leads to confusion over how to meet code and which products to use. One of the biggest changes to complying with the Code, is the requirement of continuous insulation (ci).

Continuous Insulation (ci): An uninterrupted layer of insulation that spans over structural members without thermal bridging, other than fasteners and services. A continuous layer of insulation helps reduce the potential for condensation within the wall where mold and mildew can accumulate undetected.
